

# What makes EDGE a unique green building standard?

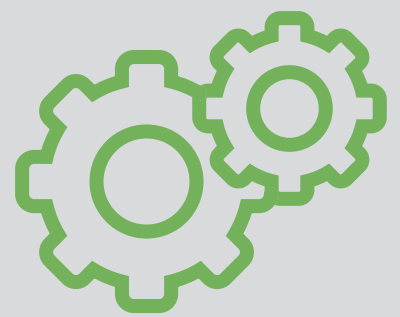

## Quantification

EDGE is an entirely quantitative green building standard. Each measure selected corresponds to a percentage improvement across different resource-efficiency categories compared to a local baseline.

## Standardisation

The baseline in EDGE is calculated using a standard methodology, meaning that companies and investors can take a standardised approach across a portfolio of buildings around the world.

## Comparability

There are local baselines available in EDGE for every country in the world, making it possible to accurately compare the resource efficiency of buildings across countries and continents.

## Scaleability

The agile nature of the EDGE App and the streamlined online process make it possible to scale green building certification across thousands of buildings, existing and new.
